

Connect to a Company's Mainframe

The next lecture explains how you can connect to a company's mainframe. If you are working for a software company then you will be provided with an IP Address of the Mainframe.

To connect to your Mainframe, open your 3270 Terminal emulator. Then click on connection panel(this will be under the option "File". Then just give this IP address and port no. 23.

It will then connect to your Mainframe and present to you a login screen. Some company use other port too like 22. If the port is different it will be provided by your company.

That is it. You are now connected to the Mainframe. Just use the Userid and password provided by your company to logon to the TSO environment.
